in LinkedIn (<https://www.linkedin.com/in/josue-rengel-9093b9258/>)

 GitHub (<https://github.com/IsRengel>)

EDUCATION

B.Sc. in Information Systems Engineering
Universidad Internacional del Ecuador (UIDE)
2024 - Present

Technical High School Diploma – Accounting Services
Colegio de Bachillerato Soberanía Nacional
2015 - 2021

INTERESTS

Sports & Fitness (Gym, Football, Basketball)

Reading and continuous learning

Open-source development and collaboration

Music enthusiast

Drawing and creative illustration

CAREER PROFILE

DevOps Engineer specializing in cloud infrastructure, platform engineering, and automation. I design and operate secure, scalable, and cost-efficient systems primarily on AWS, with experience in Kubernetes, Infrastructure as Code, and CI/CD automation.

My work focuses on building reliable platforms that support backend services and data-intensive workloads. I have hands-on experience implementing Kubernetes-based environments, infrastructure provisioning with Terraform, automated deployment pipelines, and observability systems using metrics, logs, and APM tools.

I have also worked on large-scale data platforms based on Data Lake and Data Warehouse architectures for processing high-volume datasets, implementing layered data models such as Bronze, Silver, and Gold to structure ingestion, transformation, and analytics workflows.

Additionally, I have participated in the deployment of AI-related platforms on AWS, including services based on Amazon Bedrock and MCP servers used for running and integrating AI models within production systems.

I also work extensively with DevSecOps practices, including secure networking, VPN access, TLS management, secrets handling, and infrastructure hardening.

My background in backend development allows me to bridge the gap between infrastructure and application development, enabling teams to deliver software faster and more reliably.

I am passionate about solving complex infrastructure problems, continuously improving systems, and learning new technologies.

AWS	Azure	Terraform	Kubernetes	Docker	CI/CD	GitHub Actions	Linux	Python	Go	SQL
DevOps	Platform Engineering	Infrastructure as Code	Observability	Prometheus	Grafana	Datadog				
Networking	VPN	TLS	GitOps	Cloud Infrastructure						

EXPERIENCES

DevOps Engineer

Mar 2024 - Present

Plika

Design, implementation, and operation of cloud infrastructure primarily on AWS, supporting production systems and data-intensive workloads.

Provisioning and management of Kubernetes clusters for scalable application platforms, data processing workloads, and backend services.

Implementation of Infrastructure as Code (Terraform) to automate infrastructure provisioning, configuration, and lifecycle management.

Development of CI/CD pipelines to enable automated builds, testing, and deployments, improving release reliability and delivery speed.

Design and implementation of data platforms based on Data Lake and Data Warehouse architectures to support analytics workloads and large-scale data processing.

Implementation of layered data architectures using the Medallion model (Bronze, Silver, Gold) to structure data ingestion, transformation, and consumption pipelines.

Participation in the deployment of AI platforms on AWS, including services based on Amazon Bedrock and the deployment of MCP servers used to run and integrate AI models into production environments.

Design and implementation of secure infrastructure practices including secrets management, TLS configuration, and controlled access through secure networking and VPN-based connectivity.

Infrastructure scaling strategies including horizontal and vertical scaling to support variable workloads.

Implementation of observability practices using metrics, centralized logging, and APM tools to monitor system health, performance, and reliability.

Cloud cost optimization through resource analysis, right-sizing, and improved workload distribution.

Collaboration with engineering teams to align infrastructure architecture with backend services, data pipelines, and analytics platforms.

Backend Developer

Aug 2023 - Oct 2024

Plika

Backend development using Python with a strong focus on building high-performance APIs using FastAPI.

Development and maintenance of backend services using Django for business-critical systems.

Design and implementation of RESTful APIs following clean architecture principles with emphasis on scalability, maintainability, and performance.

Database schema design, query optimization, and performance tuning for production workloads.

Integration of backend services with cloud infrastructure, authentication systems, and external APIs.

Collaboration with DevOps and infrastructure layers to ensure applications ran efficiently in containerized and cloud-based environments.

Participation in improving deployment workflows and aligning backend services with CI/CD pipelines and cloud infrastructure.

Data Engineer

Jun 2023 - Aug 2023

Plika

Design and implementation of data pipelines to support data processing and analytics workflows.

Development of data ingestion and transformation processes for structured and semi-structured datasets.

Collaboration with backend and infrastructure teams to integrate data pipelines with application services.

Support for data processing environments and infrastructure required for analytics workloads.

Participation in the early design of scalable data architectures supporting data lake and analytical workloads.

DevOps Consultant (Freelance)

Jul 2022 - Present

Latix

Provision of DevOps and cloud consulting services for multiple companies, supporting infrastructure design, platform deployments, and operational improvements.

Design and implementation of cloud infrastructure on AWS using Infrastructure as Code (Terraform) to enable reproducible and scalable environments.

Deployment, optimization, and operational support of Kubernetes clusters, including workload scaling strategies and cluster resource optimization.

Infrastructure cost audits and optimization initiatives, identifying inefficiencies and implementing strategies to significantly reduce cloud spending.

Implementation of monitoring and observability platforms using metrics, logs, and APM tools to improve system visibility and reliability.

Development of automation workflows for infrastructure provisioning, deployment pipelines, and operational tasks.

Support for the deployment of AI-related platforms and services using AWS technologies such as Amazon Bedrock.

Collaboration with engineering teams to improve platform reliability, deployment processes, and cloud architecture.

PROJECTS

SKILLS & PROFICIENCY

Amazon Web Services (AWS)

Kubernetes

Terraform (Infrastructure as Code)

Docker & Containerization

CI/CD Automation

GitOps (GitHub, GitHub Actions)

Observability (Grafana, Metrics, Logs, APM)

Linux Systems & Bash Scripting

Cloud Networking (VPN, TLS, Secure Access)

Python

FastAPI

Django

SQL & Data Workflows

Go

Microsoft Azure

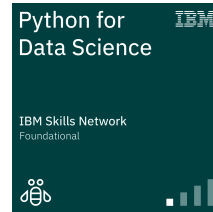

☀ COURSES & CERTIFICATES

AWS Certified Cloud Practitioner

Issuer: Amazon Web Services Training and C...

PROVIDED BY

Python for Data Science

Issuer: IBM
